                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to viral vectors and methods for producing transgenic plants that express heterologous DNA that encode a ruminant lysozyme, preferably bovine. This lysozyme protects against diseases caused by plant pathogens particularly bacterial pathogens. The method is useful for producing bovine lysozyme in host plants e.g. grapevines. Plasmid encoding a recombinant plant virus which comprises a bovine lysozyme encoding nucleic acid, is useful for producing bovine lysozyme encoding nucleic acid, is recombinant source of BoLys protein for producing bovine lysozyme protein which acts as an anti-Xylella reagent for development of a recombinant source of BoLys protein for treating grapevines against Pierce's disease (PD). The method is useful for protecting grapevines against Xylella fastidiosa bacterium infection that causes PD. The present sequence is bovine lysozyme DNA.

This lysozyme protects against diseases caused by plant pathogens particularly bacterial pathogens. The method is useful for producing bovine lysozyme in host plants e.g. grapevines. Plasmid encoding a recombinant plant virus which comprises a bovine lysozyme encoding nucleic acid, is useful for producing bovine lysozyme protectin which acts as an anti-Xylella reagent for development of a recombinant source of BoLys protectin for treating grapevines against tylella fastidiosa bacterium infection that causes PD. The against systella fastidiosa bacterium infection that causes PD. The

                                 used in the transgenic plant of the invention. The transgenic plant is resistant to plant pathogens and contains heterologous DNA encoding a ruminant or ruminant-like lysozyme, the plant expresses sufficient levels of the lysozyme to render it less susceptible to the pathogens than the wild-type plant. The plants are resistant to bacterial pathogens such as
                                                                                                                                                                                                                                                                                                                                                                                                                        CDS

```

```
The 3'-noncoding sequence does not contain a polyadenylation signal or a poly (A)+ tail. The 5'-terminus does not contain the ATG triplet corresponding to the translation initiation codon fo the pre-lysozyme C2 mRNA. Thus the cDNA insert encodes 16 amino acids amino-terminal to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 964 BP; 298 A; 165 C; 200 G; 301 T; 0 other;

The lysozyme encoded by this sequence has a greater ability to lyse gram negative bacteria than hen egg white lysozyme and also has a greater stability. The lysozyme may be applied directly to treat or protect plants such as potatoes, tobacco, tomatos, carrots, apples, sunflowers, petunias and violets from plant pathogens such as Pseudomonas, Agrobacterium, Xanthomonas, Erwinia and Clavibacter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protection of plants against plant pathogens - by transforma with DNA encoding a ruminant or ruminant like lysozyme, esp. bovine lysozyme C

                       The invention relates to a method of diagnosing (I) the onset or cc progression of benign prostatic hyperplasia (BPH), or screening (II) for cor identifying an agent that modulates the onset or progression of BPH.

CC The method is based on changes in gene expression in BPH tissue isolated crom patients exhibiting different clinical states of prostate compared to normal prostate tissue. (I) comprises compared to normal prostate tissue. (I) comprises composed to normal prostate tissue. (I) comprises preparing a first gene expression profile configuration as econd gene expression profile of the agent exposed configuration and comparing the first and second gene expression profiles. (I) susful for identifying an agent that modulates the onset or progression configuration for level in a tissue or cells, by comparing the expression of BPH. (II) is configurated to fix the expression level in a tissue or cells, by comparing the expression configuration in the tissue or cells to the compared to the expression of gene in the database, and displaying the compared to the expression level in BPH. Agents using (II) are useful for treating BPH or prostate cancer. ABK64106-ABK6480 represent human configuration prostatic hyperplasia gene sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying drugs for and diagnosing benign prostatic hyperplasia, by detecting expression levels of one or more genes in prostate cells from patient that are differentially regulated compared to normal prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

                                                Human lysozyme DNA can be used to obtain transgenic animals, e.g. mice. It can also be produced by culturing animal cells, and it can promote the genetic expression of these animal cells.

Also, DNA encoding various proteins can be linked to the 3' end of the HL signal peptide so that it is downstream of the promoter of the expression vector. Expression of such proteins is possible in E. coli, Bacillus subtilis, yeast or animal cells. Lysozyme

Novel macrophage-expressed nucleic acids and polypeptides for diagnosis and treatment of inflammatory, autoimmune, neurological, myeloid or lymphoid cell disorders, cancer and for promoting wound healing

Claim 1; Page 139-140; 158pp; English.

CC differentiation and survival of pluripotent and totipotent stem cells call differentiation and survival of pluripotent and totipotent stem cells co differentiation and survival of pluripotent and totipotent stem cells co differentiation and survival of pluripotent and totipotent stem cells co differentiation and survival of pluripotent at the protein is used to manipulate stem cells in culture to give rise to concurre protein is used to manipulate stem cells in culture to give rise to concurre protein is used to manipulate stem cells in culture to give rise to concurre the treatment of protein culture to give rise to by illness, accidental damage or genetic disorders, induces the concurred concurred the treatment of central and peripheral nervous system conditions and neuropathies, such as Alzheimer's, Parkinson's disease, concurred the treatment of central and peripheral nervous system constanting lymphoid cell disorders; platelet disorders such as thrombocytopenia and osteoporosis, osteoarthritis, bone degenerative disorders or periodontal disease and for regeneration of bone, cartilage, constant and ligament and in tissue repair, healing of burns, incisions considered the constant protection, treatment constant protection and disorders such as severe combined immunodeficiency (SCID), bacterial or fungal infections, cartilage, constant protection as asthma or other respiratory problems and is involved in thrombolysis or thrombosis is useful in treatment of coagulation and other haemostatic events in treatment of coagulation constants and the respiratory problems and is involved constants. Fertility of male or female subjects, incisions, fertility of male or female subjects, and constants respectively. reperfusion injury, shock, sepsis, immune responses, cancer and myeloid leukaemia and myelodysplastic syndromes. The protein exhibits activity relating to angiogenesis, cytokine, stem cell growth factor activity and transgenic animals. Macrophage-expressed molecule is useful treating The present invention relates to an isolated macrophage-expressed cDNA inflammatory conditions such as nephritis, Crohn's disease, ischaemiaits protein. The invention is used in gene therapy and in creating of male temale subjects,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC in identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity cand to produce other types of data and products dependent on DNA and CC amino acid sequences ASS64197-AAS9454 represent novel human cc diagnostic coding sequences of the invention.

(I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Page 4747-4748; 11750pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Schlegel R,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL6164 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC extivity and can be used in gene therapy. MI can be used for screening CC an anti-neoplastic agent, and can be used for product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC structure and/or properties of the agent. MI can be used in the CC comparation and can be used in the CC comparation and conversation convey the chemical CC comparation and conversation conversation can be used in the CC comparation and conversation conversation can be used in the CC comparation and conversation conversation can be used in the CC comparation according to the conversation can be used in the CC comparation and conversation or pancreatic cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A cDNA bank was constructed using total RNA isolated from the human lymphoma cell line U-937. The bank was tested by hybridising with two radio-labeled 17-mer oligonucleotides (equiv. to the AA sequences 26-31 and 63-68 of HLZ). Clones isolated were designated pHL 14-1; pHL21 and pHL 23 (contg. an approx. 500 bp insert) and pHL8 (contg. a 300 bp insert).
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 490 BP; 122 A; 100 C; 149 G; 119 T; 0 other;

                       amino acids, it encodes the entire sequence of human pre-lysozyme C of placental origin in addition to a translational stop signal. The mature lysozyme C corresponding to the pre-lysozyme C encoded by AAN92054 has the same AA sequence as human milk lysozyme. AAN92054 differs from the nucleotide sequence of the cDNAs encoding human pre-lysozyme C isolated from human histlocytic lymphoma cell line|U-937 (see FT tags a and b). However, these nucleic acid differences do not alter the amino acid
